

Performance Data and Comparisons

The performance characteristics of Cardinal's LoE® products are shown on the attached insulating glass performance charts. The following products and combination of products are compared:

- IG units with nominal 3mm and 6mm glass substrates;
- IG units with clear, green, gray, and bronze non-coated glass substrates;
- IG units with LoE²-272®, LoE²-270®, LoE³-366®, and LoE³-340™ on the #2 glass surface;
- IG units with LoE-180® on the #2 or #3 glass surfaces;
- IG units with green, gray, or bronze outdoor glass substrates with LoE-180®, LoE²-272®, LoE²-270®, LoE³-366®, LoE³-340™ or LoE-180® on the #3 Indoor glass surface;
- IG units with LoE²-272®, LoE²-270®, LoE³-366®, LoE³-340™ or LoE-180® on the #2 glass surface with LoE-i89® on the #4 glass surface.

Although the Winter U-factors are not affected when Cardinal's LoE® coatings are used on the #2 or #3 glass surface, the Shading Coefficient and Solar Heat Gain Coefficient will be higher when the coatings are on the #3 glass surface compared to the #2 glass surface.

Cardinal does not recommend the use of LoE® coatings on tinted substrates; therefore, there is no performance data listed for these combinations. However, Cardinal will supply IG units with a tinted lite outdoors and clear LoE® coated products on (surface #3) indoors.

Cardinal also does not recommend solar control LoE® coatings (LoE²-272®, LoE²-270®, LoE³-366®, and LoE³-340™) be used on the #3 surface of a dual pane IG unit with a clear outdoor lite. The potential for having inside glass breakage from thermally-induced stress is increased. These coatings are designed as second surface coatings in a dual pane IG unit. The only LoE® coatings recommended for use on the #3 surface of a dual pane IG unit with a clear outdoor lite is LoE-180® and LoE-i89®.

Notes:

- (1) Data was calculated using LBNL Window computer program with NFRC environmental conditions.
- (2) Calculations based on 13 mm (1/2") airspace, 3 mm (1/8") glass, and 90% Argon gas fill level.
- (3) Comfort Indoor Glass Temperatures are for the center portion of the glass.
- (4) Shading Coefficient (SC) can be calculated by dividing SHGC by 0.87.
- (5) The UV Transmittance is determined as an average for wavelengths 310 -380 nm.
- (6) UV Damage Weighted Transmittance (T_{dw}) is the weighted average for wavelengths 300 - 700 nm (based on CIE 89/3).

Notes:

- (1) Data was calculated using LBNL Window computer program with NFRC environmental conditions.
- (2) Calculations based on 9.8 mm (3/8") airspace, 3.0 mm (1/8") glass, and 90% Argon gas fill level.
- (3) Comfort Indoor Glass Temperatures are for the center portion of the glass.
- (4) Shading Coefficient (SC) can be calculated by dividing SHGC by 0.87.
- (5) The UV Transmittance is determined as an average for wavelengths 310 -380 nm.
- (6) UV Damage Weighted Transmittance (T_{dw}) is the weighted average for wavelengths 300 - 700 nm (based on CIE 89/3).

The following low emissivity (low-E) coated glass products are grouped according to their construction make-ups for comparisons of optical and thermal performances. This table includes the most commonly used low-E coatings in the market place. If further performance information is required on these or other low-E glass products, please contact Cardinal Technology Center.
